PROJECT EXPERIENCE

Company Name	State, Country
Job Title	Mon Year - Mon Year
- Each bullet should stand on its own, not exceed two lines and answer the questions - what is the business problem, what was the technical solution built (be detailed), and what was the quantitative impact on business. - For large projects that cannot be detailed in a single two-lined bullet break the content into different aspects - one bullet for feature engineering, one for modelling, one for explainability, etc. - each still following the former format. - Each bullet must start with an action word (examples in next page) which are ideally technical (Developed/Analyzed) in nature for an entry-level DS resume, and more collaborative for higher-level roles (Spearheaded/Architected). (Example) Mapped application logs to a Finite State Machine and used Bayesian networks to help identify root-cause (accuracy ~YY%) of application errors, reducing issue resolution time by ~XX%. - When projects/work experience lead to publication/patent, instead of listing them separately, mention it within your bullet to save space and allow a reviewer to save time to assess the impact of your projects. (Example) Implemented an ensemble model (Logistic Regression, XGBoost, and SVM) to predict (accuracy ~XX%) and issues in order processing thereby improving customer NPS score by YY% (Patent Approved US10713706B1).	
Job Title	Mon Year - Mon Year
- For entry level roles, create multiple version of your resume based on how diversity in technical skills is. E.g. one resume that is heavy on NLP project, another on forecasting etc. Use the most apt resume when asking for referrals. (Example for forecasting) Experimented with ETS, ARIMA, Prophet, DeepAR for forecasting volumes of Ring product sales to allow the business to proactively work with payment vendors. Achieved MAPE of ~X% with the SARIMA model. - For mid/senior-role, create different resume based on different business domains you have worked in. E.g. one resume focusing on supply chain, one on retail, another maybe on product analytics etc. (Example for supply chain) Led 5 developers across sales, fulfillment, and delivery teams to develop a Hadoop ETL pipeline and an XGBRegressor that improved accuracy of Estimated Delivery Date (EDD) by ~XX% and NPS by YY% - Mix in engineering-related work (scaling/operation excellence/MLOps), either within your project or as stand-alone bullets. For DS/ML roles, engineering work can be on lighter side, around 15-20% of your bullets. (Example) Developed CI/CD pipelines and Operational Excellence guidelines (testing, code/science reviews, monitoring) for deploying models on AWS (using AWS Lambda, ECR, SageMaker) reducing time to production by ~XX%.	

PROJECTS

Project Title	[Optional] Affiliation
- For projects also continue to follow the first central tenant - "Each bullet should stand on its own.." , but instead of business quantitative impact compare your work to the state-of-the-art (SOTA) work in that field. (Example) <i>Suggestion Mining</i>: Developed a Shared Parameter LSTM with adversarial loss and orthogonality constraints to leverage multitask learning for detecting suggestions in Amazon reviews. (F1 score 0.78, equaling SOTA). (GitHub)	

EDUCATION

College Name	State, Country
Name of Degree, [Optional] Specialization [Optional] GPA: X	Mon Year - Mon Year
Courses: <Mention coursework such that they are likely to match with keywords in the job posting>	

SKILLS

Competencies: Add DS/ML model/concepts based on your skillset and keywords in job posting. Take the time to edit this section, as it improves the chances of getting a callback (See next page of top competencies to mention)

Programming Languages: Comma-separate list in order of competency. E.g. Python, SQL, C

Tools/Frameworks: Comma-separate list in order of your competency e.g. PyTorch, TensorFlow, Keras, AWS

ACTION WORDS

Analyzed	Engineered	Evaluated	Established	Deployed	Monitored
Implemented	Optimized	Resolved	Enhanced	Modeled	Integrated
Developed	Automated	Spearheaded	Innovated	Investigated	Streamlined
Architected	Designed	Collaborated	Leveraged	Validated	Utilized

COMPETENCIES

I have divided the competencies into five sections based on my experience working in the industry thus far and working with mentees. This is not a comprehensive list.

Only use those that are relevant for the role you are applying! Tweak them based on the job posting. For instance, if the job posting mentioned “Regression Analysis” instead of “Linear Regression” then use “Regression Analysis” (given you know it)

The bolded ones are a “always good to have” type of skills.

<u>Basic ML</u> Linear Regression Logistic Regression Decision Trees Random Forests Support Vector Machines K-Means Clustering Gradient Boosted Machines Principal Component Analysis	<u>NLP</u> Text Processing LSTM GRU Transformers Word Embedding (Word2Vec, BERT) GPT Generative AI	<u>ReSys</u> Aprior Algorithm Collaborative Filtering Matrix Factorization SVD Two-tower NNs	<u>Forecasting</u> ETS/Exponential Smoothing ARIMA/SARIMA/ SARIMAX Prophet/NeuralProphet DeepAR	<u>Others</u> Ensemble Learning Hypothesis Testing A/B Testing Isolation Forests Local Outlier Factor Partial Dependence Plots Individual Conditional Expectation LIME SHAP
---	--	---	---	--

TOOLS/Frameworks

PySpark PyTorch Keras TensorFlow Sklearn	Pandas Numpy StatsModels Matplotlib Seaborn	Tableau AWS GCP Azure Docker	Airflow Github/Git Kubernetes Kafka
--	---	--	--

COMMON BUSINESS METRICS

These can be used to articulate the business impact you had, primarily in the retail domain. However, it can help you get started in other domains as well.

Remember, from the perspective of a hiring manager they are looking for **data scientist who understand that their responsibility is to deliver business impact, not be just a technical-expert who knows a ton of models**. So spend time understanding what the impact of your projects were.

Conversion Rate Click-Through Rate Revenue Per User (ARPU) Average Order Value Gross Margin	User Engagement Net Promoter Score (NPS) Customer Satisfaction (CSAT) Score	Churn Rate Perfect Order Index Customer Life Time Value Cost Per Mile (CPM)	Customer Acquisition Cost Retention Rate Time to Conversion
